

**Definition 1.** We say that a function's limit exists at  $x = x_0$ , i.e

$$\lim_{x \rightarrow x_0} f(x) = L$$

if this statement is true:  $\forall \epsilon > 0, \exists \delta > 0$  such that if  $0 < |x - x_0| < \delta$ , then

$$|f(x) - L| < \epsilon$$

**Example 1.** Let  $f(x) = \frac{(x+1)(x-1)}{(x+1)x}$ .

!!!!!!!!!!!!demos !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

We see that from the graph

$$\begin{aligned}\lim_{x \rightarrow 1} f(x) &= 0 \\ \lim_{x \rightarrow 0} f(x) &= DNE \\ \lim_{x \rightarrow -1} f(x) &= 2\end{aligned}$$

Notes: The limit of a function at some points  $x_0$  has nothing to do with the function value at that point.

**Theorem 1.**

$$\begin{aligned}\lim(f(x) \pm g(x)) &= \lim f(x) \pm \lim g(x) \\ \lim(f(x) \times g(x)) &= \lim f(x) \times \lim g(x) \\ \lim \frac{f(x)}{g(x)} &= \frac{\lim f(x)}{\lim g(x)}\end{aligned}$$

**Example 2.**

$$\lim_{x \rightarrow 0} (\cos x + \sin x) = \lim_{x \rightarrow 0} \cos x + \lim_{x \rightarrow 0} \sin x = 1 + 0 = 1$$

**Example 3.**

$$\lim_{x \rightarrow 1} \frac{x^2}{x+1} = \frac{\lim_{x \rightarrow 1} x^2}{\lim_{x \rightarrow 1} (x+1)} = \frac{1}{2}$$

**Example 4.**

$$\lim_{x \rightarrow -1} \frac{x^2 + 3x + 2}{x + 1}$$

If we simply plug in the value  $x = -1$ , we will have a  $0/0$  situation, this is not good. However, we see that the the term causing the problem,  $x + 1$ , can be canceled. Thus

$$\begin{aligned}\lim_{x \rightarrow -1} \frac{x^2 + 3x + 2}{x + 1} &= \lim_{x \rightarrow -1} \frac{(x+1)(x+2)}{x+1} \\ &= \lim_{x \rightarrow -1} x + 2 \\ &= 1\end{aligned}$$

Although we know that the function value at  $x = -1$  is still undefined, but its limit at  $x = -1$  has nothing to do with the function.

**Example 5.**

$$\lim_{x \rightarrow 2} \frac{x-2}{\sqrt{x-1}-1}$$

*If we simply put the the value  $x = 2$ , we again encounter the  $0/0$  situation. However, when we see square root, try to use the square difference formula to simplify the expression first.*

$$\begin{aligned} \lim_{x \rightarrow 2} \frac{x-2}{\sqrt{x-1}-1} &= \lim_{x \rightarrow 2} \frac{(x-2)(\sqrt{x-1}+1)}{(\sqrt{x-1}-1)(\sqrt{x-1}+1)} \\ &= \lim_{x \rightarrow 2} \frac{(x-2)(\sqrt{x-1}+1)}{x-2} \\ &= \lim_{x \rightarrow 2} \sqrt{x-1}+1 \\ &= 2 \end{aligned}$$

Note: When dealing with limit, if some situations occur(e.g  $0/0$ ), remember to simplify or adjust the expression before you further calculate.
